LabelTruth | Personalized Product Scoring

One product record, different user-specific scores. LabelTruth assesses nutritional fit for a selected profile, then adjusts for personal goals—without pretending one score means “healthy for everyone.”

PERSONAL MATCH SCORE
75% × Profile Suitability + 25% × Preference Match

PROFILE SUITABILITY (0–100)
Score nutrition using profile-specific weights and relevant food-category thresholds.

PREFERENCE MATCH (0–100)
Weighted fit to goals such as more protein, lower sugar, higher fibre or preferred oils.

Three illustrative examples

1. General health-aware

Balanced everyday nutrition; no specific medical dietary needs.

Product context: Example snack: balanced overall, moderate sugar, reasonable fibre and sodium.

Profile fit	Preference fit	MATCH
78	80	79

Calculation: 0.75 × 78 + 0.25 × 80 = 78.5 → 79

Interpretation: a reasonable fit for this person's general priorities.

2. Diabetes-aware

Places more emphasis on carbohydrate suitability, serving size and fibre.

Product context: Same snack: 24 g carbs, 8 g sugar and 3 g fibre per illustrative serving.

Profile fit	Preference fit	MATCH
59	65	61

Calculation: 0.75 × 59 + 0.25 × 65 = 60.5 → 61

Interpretation: review total carbohydrates and serving size; score is not a safety guarantee.

3. Protein-conscious

Prioritizes protein intake and may set a personal protein target.

Product context: Same snack: protein amount is modest relative to the user's goal.

Profile fit	Preference fit	MATCH
74	55	69

Calculation: 0.75 × 74 + 0.25 × 55 = 69.25 → 69

Interpretation: may rank below higher-protein alternatives for this user.

Hard exclusions come first
If palm-oil avoidance is marked “strict,” exclude products where palm oil is confirmed instead of allowing a high protein score to compensate. If oil is undisclosed, show “unknown”—do not assume it contains palm oil.

Keep trust separate
Show claim integrity and evidence completeness separately from nutrition fit. Flag contradicted claims, stale sources and missing nutrition data; do not let a good match score hide a serious warning.

Implementation guardrails
Normalize by serving size and food category. Use validated thresholds; handle missing data explicitly. Profiles and weights shown here are prototype choices, not clinically validated advice.

Prototype examples only. Scores illustrate personalization logic; they are not clinical assessments or validated product ratings.
